

NumisBook

A cloud-based SaaS workspace for managing and exploring a coin collection

MY ROLE Product owner, designer and builder	SCOPE MVP, concept to deployed SaaS	DATA & MEDIA Neon PostgreSQL, Cloudflare R2	BUILT WITH Figma, Claude Code
--	--	--	----------------------------------

The problem

Coin collectors often manage their collections across spreadsheets, cloud storage and physical documents, making it difficult to maintain a complete view of their inventory, associated purchase documentation and collection value.

The product decision

Build a **cloud-based SaaS application** that centralizes the management of a coin collection in a structured workspace.

Collectors can store and classify coins, associate images and purchase documentation with individual items, and explore collection analytics such as acquisition costs. An AI assistant was added to enable natural-language exploration of the collector's own data.

Key product decisions

Cloud-first architecture

Enable persistent access to collection data and media across devices.

Structured collection model

Represent coins and their attributes as structured data rather than unstructured notes or spreadsheets.

Integrated documentation

Keep coin information, images and purchase documentation connected within the same workflow.

AI grounded in collection data

Use the collector's own data as context for natural-language exploration.

Outcome

- Delivered and deployed a **working coin collection management SaaS MVP**.
- Centralized coin metadata, images, purchase information and associated documentation in an intuitive UX.
- Enabled **natural-language exploration** of collection data through an AI assistant.
- Established a **data and AI architecture** that enables future capabilities such as auction discovery and market-to-collection value analysis.

My role

Product strategy

- Defined the product concept, target user and MVP scope.
- Identified and prioritized the core workflows and information needs of collectors.

Data & architecture

- Designed the data model around the attributes and relationships required to represent a coin collection.
- Designed the data and media architecture using Neon PostgreSQL and Cloudflare R2.

UX

- Translated collector workflows and information needs into product requirements and UX flows.
- Designed the experience and information architecture in Figma.

Delivery

- Built and deployed the application end to end using Claude Code as an AI-assisted development environment.
- Implemented the product across the frontend, data layer, media storage and AI functionality.
