

Stock Portfolio Viewer

A local-first, broker-agnostic portfolio workspace for self-directed investors

MY ROLE Product owner, designer and builder	SCOPE MVP, concept to working product	FIRST INTEGRATION Interactive Brokers (Flex Queries)	BUILT WITH Figma, Claude Code
--	--	---	----------------------------------

The problem

Investors with accounts across several brokers lack a single, customizable view of their portfolio. Broker platforms are optimized for managing individual accounts. They are not built to combine data across providers, analyze historical performance in a personalized way, or turn portfolio data into actionable insight.

The product decision

Build a **local-first** portfolio management application that lets investors import broker data into a single private workspace. The MVP integrates Interactive Brokers through Flex Queries. Broker ingestion is deliberately separated from the portfolio domain model, so additional brokers can be added later without redesigning the product.

Key product decisions

Local-first Sensitive financial data remains under the user's control.	IBKR-first MVP Start with one broker while validating the core product experience.
Broker abstraction Separate broker-specific ingestion from the portfolio domain model.	AI-assisted analysis Allow natural-language exploration of portfolio data without replacing the user's investment judgment.

Outcome

- Delivered a **working portfolio-management MVP** using Interactive Brokers as the first broker integration.
- Consolidated positions, transactions, performance, allocation and dividend information into multiple personalized views.
- Enabled **natural-language exploration** of portfolio data through an AI assistant.
- Established a **broker-adapter architecture** that allows additional data providers to be integrated without redesigning the product.

My role

Product strategy - Defined the product concept, target user and MVP scope. - Identified core user workflows and the information needs of a self-directed investor.	Data & architecture - Designed the ingestion pipeline using Interactive Brokers Flex Queries. - Defined the normalized data model that makes the portfolio layer broker-agnostic.
UX - Translated investor preferences and analysis needs into product requirements. - Designed the experience and information architecture in Figma.	Delivery - Built the application with Claude Code as an AI-assisted development environment. - Implemented the product end to end: frontend, data layer and AI functionality.
