

Digital Twin

An AI-powered conversational interface to a professional profile

MY ROLE	SCOPE	CORE APPROACH	TARGET USERS
Product owner, designer and builder	Concept to working product	AI grounded in curated career data	Recruiters, hiring managers, collaborators

The problem

Traditional career websites present information about a candidate through static pages, requiring visitors to navigate through experience, projects, skills and education to understand their profile.

This creates an opportunity to make the career experience more interactive: instead of simply reading about a candidate, visitors can ask questions and explore the candidate's experience through a conversational interface.

The product decision

Build an **AI-powered Digital Twin** that acts as an interactive interface to my professional profile.

The product combines structured information about my career, experience, projects and skills with an AI conversational layer, allowing visitors to ask natural-language questions about my background and receive answers grounded in my professional information.

The goal was not to create an AI representation capable of impersonating me, but to experiment with a more engaging way of presenting professional information while keeping the underlying knowledge constrained to relevant career data.

Key product decisions

AI as an interface

Use conversational AI as an alternative way to explore a professional profile rather than simply adding a chatbot to the website.

Grounded knowledge

Base responses on curated information about my actual experience, projects and skills rather than relying on the model's general knowledge.

Structured professional context

Organize career information so that the AI can retrieve and connect relevant experiences when answering questions.

Controlled scope

Focus the Digital Twin on professional topics and career-related questions to maintain relevance and reduce unsupported responses.

Conversational discovery

Design the experience around questions that a recruiter, hiring manager or potential collaborator might naturally ask.

Outcome

- Delivered an **interactive AI-powered Digital Twin** capable of answering questions about my professional background.
- Transformed a static career profile into a **conversational experience**.
- Created a **structured knowledge base** covering professional experience, projects, skills and other relevant career information.
- Demonstrated how generative AI can be used as a **product interface** for navigating structured personal information.
- Established a foundation for further experimentation with personalized AI agents and professional knowledge systems.

My role

Product strategy

- Defined the Digital Twin concept and its target users.
- Identified the types of questions and information that should be supported by the experience.
- Defined the product scope and boundaries of the AI assistant.

AI & data

- Structured and curated the information required to represent my professional profile.
- Designed the approach for grounding AI responses in career-specific information.
- Defined the conversational experience and relevant interaction patterns.

UX

- Designed the interaction between the traditional career website and the conversational Digital Twin.
- Focused the experience on helping visitors discover relevant information through natural-language questions.

Delivery

- Designed and implemented the Digital Twin end to end.
- Integrated the AI capabilities and supporting data layer.
- Tested conversational scenarios to improve answer relevance and reliability.
