

Career Site

A career website that is also its own printed CV

MY ROLE	SCOPE	CORE APPROACH	TARGET USERS
Product owner, designer and builder	Concept to live site	One source for site and CV	Recruiters and hiring managers

The problem

Recruiters and hiring managers skim a candidate's profile quickly, and often print it or save it as a PDF. A CV lists what a candidate claims, but the evidence behind those claims (the projects, the repositories and the decisions) sits elsewhere, a click or a search away.

Keeping a website and a separate CV by hand also means two documents that drift apart without anyone noticing, and one wrong date or misnamed credential costs the credibility the profile exists to earn.

The product decision

Build a **career site that is also its own printed CV**: one page that tells a hiring manager what I do, where the evidence for it is and how to reach me, and that prints, or saves as a PDF, as a complete CV.

Each role and each project has a view of its own, and each project's view offers its overview, how it was built, its business case and its source code. A separately designed CV is offered as a download, and the test suite fails whenever a fact on the page changes, until the CV has been reviewed against it.

Key product decisions

The page is the CV

Design the page for paper as well as the screen, so the site and the printed CV state the same facts.

Content separate from code

Keep every word in typed content modules, so a content change never requires touching a component.

Static by design

Generate every page ahead of time and host it on GitHub Pages: no server to run and almost no script in the browser.

Accessible from the start

Treat accessibility as a requirement: semantic HTML, keyboard navigation, visible focus and reduced motion, checked on phones and at 200% text.

Every decision recorded

Record each significant design and architecture decision with its alternatives and trade-offs, and track the work as GitHub issues, so the site stays understandable as it grows.

Outcome

- Delivered a **live career site**, deployed automatically to GitHub Pages from the main branch.
- Made the page **print as a complete CV** in Edge and Firefox, alongside a downloadable CV kept in step with it by the test suite.
- Gave **every role and project a view of its own**, including each project's overview, how it was built and its business case.
- Put a **quality gate** in front of every release: linting, type checking, tests and a build must pass before anything deploys.
- Built a **decision trail** of more than 90 design and architecture decision records that explain why the site is built the way it is.

My role

Product strategy

- Defined the site's purpose, its readers and what it must tell a hiring manager.
- Planned and prioritised the work as epics and stories in GitHub Issues.

Content & architecture

- Wrote the content from my own knowledge base, keeping every statement traceable to a verifiable source.
- Defined the architecture: a typed content model, static export and hosting on GitHub Pages.

UX

- Designed the experience and the visual design in Figma.
- Designed the printed CV as part of the same page, rather than as a separate layout.

Delivery

- Built the site with Claude Code as a virtual cross-functional team, with specialised skill workflows.
- Set up continuous integration and deployment, with browser testing through Playwright.
